

We're protecting resources.

Multi-path containers, which are frequently used in the industry, have established their reputation in the course of years. The containers allocate various parts necessary for the production in many sectors. The containers, developed after VDA- and ISO-standard, are used as charge carriers and, regarding the saving of paper and cardboard packaging, save valuable resources.

We hold the necessary know-how for container management and offer you thorough and reliable management for multi-path containers – consisting of repair, control, storage, provision and transport. The concept is adjusted to your schedule, so that it fits in your operational sequences. It is very important to us to execute processes successfully and according to your expectations in terms of availability and cleanliness.

The advantages of our container management may be summarised as follows: Cost optimisation through minimization of production downtimes due to the lack of containers, reduction of circulation and service times and finally prevention of unnecessary storage, setup and maintenance charges.

From planning processes to the procurement of goods and control of operational sequences up to the compilation of analyses of the container movements – owing to our modern software solutions you receive an holistic picture of your container and cost at any time. This gives us the opportunity to stay in close contact with your clients and suppliers. And all that to your advantage, since your suppliers are entitled to request containers online that we are able to accordingly distribute. In addition we can define minimum and maximum stock levels and compute appropriate rents for those containers. Hence, you, our customer, do not have to purchase containers nor execute any investments.

It is a fact that we encourage you to concentrate on your core business without having to worry about the administration of re-usable packages. Benefit from our service – we will not disappoint you!
